

SingleHop Releases LEAPmobile for Android and Blackberry Phones "Don't Just Surf the Internet, Control it From Your Phone with SingleHop"

Chicago based web-hosting company SingleHop releases LEAPmobile, a mobile portal to control servers through iPhone, Google's Android, and BlackBerry devices.

Chicago, IL ([PRWEB](#)) March 27, 2009 -- Chicago-based managed web-hosting provider today announced the release of their mobile portal specifically designed for Google's Android based phones, most popular being the T-Mobile G1, and all BlackBerry devices. SingleHop is focused on giving their customers as much control as possible over their servers. This dedication has led them to produce groundbreaking products like LEAP where customers control their servers through a desktop-like web interface. Now LEAPmobile will provide all the power and functionality of LEAP but accessible from an iPhone and now Android and BlackBerry phones also.

LEAPmobile will be available starting today when customers go to SingleHop.mobi on their mobile devices.

The mobile portal allows customers to:

- Control their servers. They can reboot, view bandwidth graphs and hardware details.
- Control their billing. They can see current and previous invoices, pay invoices, or submit billing questions.
- Control Support. They can submit priority or normal tickets and securely interact with technical support.

LEAPmobile is the most robust mobile portal in the industry yielding a great deal of control to customers, and is part of a development schedule to empower SingleHop's users as much as possible. As SingleHop's, VP of Operations, Andy Pace explained that "LEAPmobile allows our customers to have the same level of control over their servers through a mobile device as they would on their desktop through LEAP. Not only are we giving our customers tremendous control over our servers, we even give them control over which device they choose to control their servers from".

About SingleHop, Inc.

SingleHop, Inc., is a full service managed dedicated hosting provider that was founded on the principal of providing reliable, cost-effective dedicated services. The company was founded by Zak Boca and Dan Ushman in 2006 and currently hosts thousands of websites worldwide. SingleHop Competitors include: SoftLayer, ThePlanet, FastServers, and RackSpace. The cornerstone of Single Hop's managed hosting is the à la Carte Server Management Program, which is a full-array of transparent management services designed and tested to allow business customers to tailor their level of support to their needs or expertise. www.singlehop.com
