MedaDoc Launches mMJSuite™, a Medical Marijuana Patient Management and Intake System Easily Integrated With Any EHR and Any State's Medical Marijuana Registry

Company takes advantage of its technology that moves data between any EHR systems to enter the growing Medical Marijuana technology space.

GREAT NECK, N.Y. (PRWEB) February 15, 2019 -- MedaDoc, a rising technology company involved in conversion and integration of EHR system data announces the launch of mMJSuite™, a medical marijuana patient management and intake system that takes advantage of the company's proprietary data moving technology.

Successfully undertaking the most challenging EHR conversions, integrations and interoperability bottlenecks in the medical industry over the last five years, MedaDoc has developed a proprietary technology that allows it to extract, import and move data between any EHR systems. "We've done a lot of typical EHR conversions over the years, but one of our biggest strengths lies in our ability to extract, move and integrate clinical and administrative data in the most challenging environments," says CEO Ilya Aronovich. "And that is our value add in the Medical Marijuana industry," He continues. "Whereas there are a number MMJ patient management systems on the market, what distinguishes us is our ability to integrate our mMJSuite™ with both the provider's EHR and a particular state's Medical Marijuana Registry Database."

MedaDoc explains that there are a great deal of physicians with existing practices that are entering the medical marijuana space, but their EHRs are not designed to manage medical Marijuana-based patient encounters, and, most importantly, the EHRs don't have the ability to share or integrate data with a particular state's Medical Marijuana registry. "As a result, medical practices must engage in double entry of patient information -- once in the state's MMJ Registry and once again in the practice's EHR," says CTO Dov Davidovics. "Our mMJSuite™ obviates the need for double entry by lettings medical providers enter MMJ patient data once in either system, and have it appear in all systems -- that is, in mMJSuite™, the Medical Marijuana Registry and the EHR -- in real time," he continues.

MedaDoc has piloted mMJSuite™ with several practices, and is now making it available to any practice interested in recommending its patients for Medical Marijuana use as per their state's permissible guidelines.

About MedaDoc
MedaDoc in a NY and FL-based medical technology company focused on the successful and HIPAA-compliant migration and integration of EHR records using its proprietary technology.
