Study: EBV Can Cause Encephalitis; polyDNA Recommends Gene-Eden-VIR to Target the Latent Epstein Barr Virus

A study published on November 16, 2013 in the Spanish medical journal Revista de Neurologia found that “Infection by the Epstein-Barr virus (EBV)—either as a primary infection, a reactivation or an active chronic infection—can give rise to several clinical forms of involvement of the central nervous system (1).” polyDNA reviews the literature and recommends Gene-Eden-VIR against the latent EBV.

Rochester, NY (PRWEB) January 12, 2014 -- Studies show that the Epstein Barr Virus (EBV) can cause encephalitis (an acute inflammation of the brain), even in otherwise healthy individuals (1). The CDC notes that the Epstein Barr Virus “occurs worldwide, and most people become infected with EBV sometime during their lives. In the United States, as many as 95% of adults between 35 and 40 years of age have been infected… EBV also establishes a lifelong (latent) infection in some cells of the body's immune system. (2).” This information was last updated on May 16, 2006. polyDNA recommends Gene-Eden-VIR to help the immune system target the latent Epstein Barr Virus. This natural product was clinically proven to reduce symptoms EBV infections in a study that followed FDA guidelines.

EBV caused encephalitis is a serious condition. As the University of Maryland Medical Center reminds the public “Encephalitis symptoms can appear within 2 days to 2 weeks of exposure to the virus… In milder cases, symptoms may resemble the flu. In severe cases of encephalitis, symptoms may include: fever, headache, vomiting, lethargy and reduced consciousness, seizures, memory loss, stiff neck and back, confusion, speech, hearing, and vision problems, muscle weakness, partial paralysis, loss of consciousness, and coma (3). This information was last updated on March 14, 2013.

How is EBV encephalitis diagnosed?

When encephalitis is suspected, “a sample of cerebrospinal fluid is taken using a lumbar puncture, which involves inserting a needle between two vertebrae in the patient's lower back. The sample is taken to count white blood cells and identify specific blood cell types, to measure proteins and blood sugar levels, and to determine spinal fluid pressure. Doctors can use cerebrospinal fluid to test for herpes viruses (3).”

“The majority of people in the United States have a latent Epstein Barr Virus infection. This virus can cause an acute inflammation of the brain. We therefore recommend that Americans take Gene-Eden-VIR, a natural antiviral designed to target the latent EBV.” – Mike Evans, polyDNA

A recent post marketing clinical study published in the peer reviewed, medical journal Pharmacology & Pharmacy, in a special edition on Advances in Antiviral Drugs on August 12, 2013 showed that Gene-Eden-VIR is safe and effective (4). Additionally, up to 70% of those studied reported a decrease in viral symptoms, and users experienced an increase in overall health (4).

Each ingredient of Gene-Eden-VIR was chosen through a scientific approach. Scientists scanned thousands of scientific and medical papers published in various medical and scientific journals around the world to identify the safest, most effective natural ingredients that target the latent EBV and other latent herpes viruses. polyDNA is a biotechnology company that develops dietary supplements using the unique scientific method developed by Dr. Hanan Polansky, which is based on Computer Intuition.

In addition to his unique scientific method, Dr. Polansky published the highly acclaimed scientific discovery, called Microcompetition with Foreign DNA. The discovery explains how foreign DNA fragments, and specifically, DNA of latent viruses, cause most major diseases.

polyDNA developed Gene-Eden-VIR, an antiviral natural remedy that helps the immune system kill latent viruses.
