Instana is First Automatic Performance Monitoring Solution to Provide Jenkins Monitoring for Builds and the Jenkins Stack

Automatic APM Solution Provider Adds CI/CD Management Capabilities

SOLINGEN, Germany and SAN MATEO, Calif. (PRWEB) August 08, 2019 -- Instana continues to change the way organizations think about delivering and monitoring business applications with the addition of Jenkins Monitoring to the company’s automatic Application Performance Management (APM) solution. The leader in providing automated Application Monitoring solutions, Instana has started adding performance management for systems in other steps of the application delivery process.

“A common theme amongst Instana customers is the need to deliver and deploy quality applications faster, and Jenkins is a critical component of that delivery process,” said Peter Abrams, Instana co-founder and COO. “The latest monitoring addition to Instana’s automated APM solution for dynamic microservice applications moves up the deployment process to tackle application builds and deployment.”

Instana’s automatic Jenkins monitoring capabilities include providing performance visibility of individual builds and deployments, as well as health monitoring of the Jenkins tool stack itself – including the hosts and JVMs running Jenkins. This gives Agile Development and DevOps teams the data they need to understand exactly where they can optimize their application delivery process.

Instana’s automated Application Performance Monitoring (APM) solution discovers application service components and application infrastructure, including Jenkins, Kubernetes, and Docker. The tool automatically deploys monitoring sensors for each part of the application technology stack and traces all application requests – without requiring any human configuration or even application restarts. The solution detects changes in the application environment in real-time, adjusting its own models and visualizing the changes and impacts to performance in seconds.

Instana will be showcasing their new Jenkins infrastructure and build monitoring capabilities at the DevOps World / JenkinsWorld conference on August 12th in San Francisco. Learn more by stopping by the Instana’s Booth (Booth Number 1002) or visiting https://instana.com.

###

About Instana
As the leading provider of Automatic Application Performance Monitoring (APM) solutions for microservices, Instana has developed the automatic monitoring and AI-based analysis DevOps needs to manage the performance of modern applications. Instana is the only APM solution that automatically discovers, maps and visualizes microservice applications without continuous additional engineering. Customers using Instana achieve operational excellence and deliver better software faster. Visit https://instana.com to learn more.
