Dr. Peter Pacik Performs Augmentation Mammaplasty Study With Excellent Aesthetic Results

Dr. Peter Pacik performs augmentation mammaplasty study with excellent aesthetic results. New technique improves breast rounding and fullness and prevents breast fold lowering.

Waltham, MA (PRWEB) September 23, 2005 -- The Plastic Surgery Center (http://www.plasticsurgerypa.com/index.cfm?event=PressReleases&PressReleaseCategoryID=1&engine=SEP2305PR) is pleased to announce that its founder, Peter T. Pacik, MD, FACS, was published in the July/August 2005 issue of the Aesthetic Surgery Journal for his article, "Augmentation Mammaplasty: Enhancing Inferomedial Cleavage." I°

Dr. Pacik, certified by both the American Board of Surgery and the American Board of Plastic and Reconstructive Surgery, has been practicing since 1972 and has been involved in an ongoing study of pain control in breast enlargement surgery that now numbers 500 consecutive patients during the past 9 years. To contend with one of the more challenging aspects of augmentation mammaplasty - breast fold lowering - Dr. Pacik developed a technique that enhances breast fold lowering departing from traditional teachings.

Eschewing the common belief that though a breast can be enlarged, the innate shape of a woman's breast cannot be changed, Dr. Pacik developed a more pronounced dissection of the inner lower portion of the breast fold by enhancing this portion of the dissection. This technique enables women who have abnormally high breast folds or lateral flare of the breasts to achieve a more natural breast appearance with enhanced roundness and fullness of the inner lower area of cleavage. This is in contrast to the traditional symmetrical markings used by the majority of plastic surgeons today.

Dr. Pacik's asymmetrical markings helped reduce the problem of excessive lowering of the implants, improper seating of the breast implants, excessive upper breast fullness and inadequate rounding and cleavage of the inner lower zone of the breast resulting in a more natural breast shape, with rounding of the cleavage area and an appearance of balanced fullness.

"It has been very rewarding knowing that we have a safe technique that gives a woman the enhanced cleavage she is looking for," says Dr. Pacik.

About The Plastic Surgery Center:
Founded in 1972 by Peter T. Pacik, MD, FACS, the Plastic Surgery Center has been providing state-of-the-art cosmetic procedures and facial rejuvenation to patients in New Hampshire and New England for over 30 years. With a wide range of cosmetic procedures available including breast augmentation, breast lifts, breast reductions, body contouring, facelifts, rhinoplasty, tummy tucks and liposuction as well as facial rejuvenation procedures including chemical peels, dermabrasion, laser skin resurfacing, the Obagi Â® Blue Peel TM, Botox Â®, and facial fillers (injectables) such as Restylane and Radiesse, the doctors of the Plastic Surgery Center help clients look their best.
About Dr. Peter Pacik:
Since 1972 Dr. Peter Pacik, M.D., F.A.C.S. has operated the Plastic Surgery Center in Manchester New Hampshire and has been performing plastic surgery for patients in New Hampshire and New England. He has helped thousands of patients diminish physical imperfections, feel beautiful and confident in just a few short months after surgery.

Dr. Pacik completed his plastic surgery residency at SUNY Upstate Medical University in Syracuse, New York in 1972. He is affiliated with the Catholic Medical Center and the Elliot Hospital and is American Board certified in both Surgery and in Plastic and Reconstructive Surgery.
